# Write an application: Kalories

**Home page:** User can see a list of his meals and calories.

Calories are entered manually.

Each entry could be edited and deleted.

An entry has the following fields:
 - date
 - time
 - text
 - number of calories

User can filter date (from-to).
For example: how much calories have I had in the last week?

User can set the expected number of calories per day in a settings' panel.

When displayed, the total for that day is colored in green, otherwise it is red.

Minimal UI/UX design is needed.
